

Clients

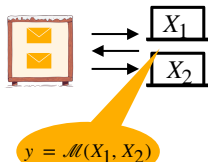

Setup And  
Inputs

$n$  clients send shares of their input to the provers and hiding commitments of these shares to the verifier.

Client  
Verification

Each client proves to the verifier and the provers in zero knowledge that their input  $x \in L$

Verifiable DP  
Protocol

The provers and verifier exchange messages. At the end the prover output  $y = \mathcal{M}(X_1, X_2)$  and the verifier decides to accept or not.
